COMMENTS TO AUTHORS

This paper examined circulating growth factor concentrations in acute and chronic pancreatitis and in patients with walled-off pancreatic necrosis. They suggested that selected growth factors and cytokines may be considered as potential diagnostic biomarkers in patients with pancreatic diseases. The manuscript is well presented and of interest. The hypothesis of the study is novel and the design of this study is appropriate. The study was done well and their results can contribute to knowledge of this topic.

COMMENTS TO AUTHORS

authors measured serum levels of PDGF-BB, TGF β -1, chemerin and HMBG1 in healthy controls and patients with AP, WOPN and CP. they found that PDGF-BB, TGF β -1 and chimeric increased only in CP, and HMBG1 was similar to controls in all forms of pancreatitis. my comments are as follow: *introduction and method sections should be shorten by avoiding repeating basing knowlege on pancreatitis. *figure 1 to 5 should be omitted and all data should be given in a table i.e parameters vs phase of pancreatitis cross table including p values.
