**COMMENTS TO AUTHORS**

The paper describes a case of intraductal papillary neoplasm of the bile duct (IPNB) in a patient with primary scleroticizing cholangitis. Although definite conclusions cannot be drawn without longitudinal follow-up, IPNB is suggested to be a part of the carcinogenesis in patients with primary scleroticizing cholangitis. The description of symptoms, imaging and laboratory data does not represent unique features for IPNB, but depict obstructive jaundice and cholangitis irrespective of cause. I believe the authors by mistake have sent a manuscript that has not undergone final editing (minor spelling mistakes, corrections marked with red, lack of explanation to some of the abbreviations). Although this gives a bad impression at first sight, the paper is still interesting to read and could be of interest if revised and prepared more carefully.

**COMMENTS TO AUTHORS**

Congratulations for the work, very interesting and well written. Very good iconography. Very detailed description of the clinical case and may be interesting the association with Behcet's syndrome and IBDU. Provide abstract In case report it would be useful to describe what kind of follow-up was performed and, if available, add some images of the various imaging modalities used. In the discussion it would be very useful include a more detailed description of clinical-diagnostic-therapeutic process of this disease

**COMMENTS TO AUTHORS**

It is the first case report of intraductal papillary neoplasm of the bile duct (IPNB) from PSC. AS a case report, it is accepted. The language must be revised before publishing.
