COMMENTS TO AUTHORS

This is an original article entitled “Antinociceptive effects of novel melatonin receptor agonists in mouse models of abdominal pain”. The study is interesting and the discussion is well-done. However, there is an important concern to me: The authors used the percentage of control (numbers of pain-related behaviors) instead of true numbers. It may not be reliable. For example, if the study group responded 3 pain-related behaviors compared to 4 pain-related behaviors of the control group. There may have 25% down but only 1 different behavior. Suggest the authors used true numbers of the [pain-related behaviors] for statistics.
