## COMMENTS TO AUTHORS

The authors describe a case of celiac disease and trichobezoar. There are two aspects that need to be clarify/discussed : 1. The first attempt to perform a jejunal biopsy was made by the Crosby capsule, which is a method not in use by decades. Why? 2. Since the authors suppose that the trichophagia was essentially due to the mental health problems of the little girl, is it possible that GFD rapidly corrected that problem? Minor points: the affiliation of dr. Juan Carlos Vitoria is missing Some typos: for example: IgA antitransglutaminasa

## COMMENTS TO AUTHORS

authors have reported very interesting case of celiac disease leading to trichophagia and trichobezoar. my minor comment is that the following sentence should be clarified "She crossed weight and height centile lines downwards during this period."

## COMMENTS TO AUTHORS

This is a well written manuscript reporting an interesting case of celiac disease-associated psychiatric disorder (trichotillomania/trichophagia). The manuscript needs only some minor polishing of the English language. This case report is an important contribution to the understanding of the broad spectrum of manifestations of celiac disease.

## COMMENTS TO AUTHORS

The study is well-written but there is not much new, except the possibility that the patient behavioral changes during celiac disease was not due to iron deficiency.
