COMMENTS TO AUTHORS

In the original case report of Tang et al. (Microcystic/reticular schwannoma of the meso-appendix: a case report with review of the literature) the authors present a unique case of a very rare type of GI Schwannomas, namely the microcystic/reticular type. Only one minor correction is needed: in the case presentation ("Clinical findings") the authors stated that the female patient had unremarkable case history, but in the first sentence they mentioned CT check up. What was the unrelated reason for the CT checkup? It should be mentioned. The histological findings are well described, the figures are well presented. The discussion of the literature is also well presented. English language needs minor polishing. After searching on large search engines, I was not able to find another case of microcystic/reticular schwannoma of the mesoappendix. After minor revision I definitely suggest to accept this case presentation for publication.

COMMENTS TO AUTHORS

This review is an comprehensive review of the literature in addition to an interesting case report. There are only some minor hints to improve this very good manuscript. Please mark the regions of interest in figure 2 (histological pictures).
