COMMENTS TO AUTHORS

This is an interesting and well presented report of two cases of colonic lipoma resected with ESD. I would like to add two minor suggestions: Could the use of EUS render the procedure safer? The last sentence in the conclusion seems redundant.

COMMENTS TO AUTHORS

The article from Korea is aim to report the two patients with large colonic lipomas and symptoms who underwent the standard endoscopic submucosal dissection for removal of the lipomas instead of conventional surgical bowel resection. The title is "Endoscopic Submucosal Dissection of a Large Colonic Lipoma: Report of Two Cases". There have some questions. The authors should to be clarified and be added the following issues in the text.

1. Please add the indications and the contraindications of endoscopic submucosal dissection for the large colonic lipomas.
2. Please also add the complications of endoscopic submucosal dissection of colon. Are they different from the other area of GI tract?
3. This technique needed a special tool and it also needed the experienced endoscopist. It can not apply in the community hospitals.
4. The clinical application of the study is very important. The authors should to be recommended the readers to apply this knowledge into routine clinical practice.

Thank you so much

COMMENTS TO AUTHORS

This paper describes two cases in which colonic lipomas could be resected by ESD successfully. This paper is interesting but several points should be addressed. 1.The sample size is too small to evaluate the efficacy and safety of ESD for colonic lipomas. 2.Before endoscopic resection of SMT, EUS should be performed to confirm that tumor is located in the submucosa. 3.The duration of each procedure should be indicated 4.Complaints of the patients presented were resolved? It is unlikely that complaints such as abdominal pain or constipation were owing to lipoma.
