## COMMENTS TO AUTHORS

The manuscript investigates the effects of single nucleotide polymorphisms (SNPs) in GST genes on survival of hepatocellular carcinoma (HCC) patients, and suggests that the GSTO2 and GSTP1 gene polymorphisms may serve as an independent prognostic marker for HCC patients. This study may be very useful for a large number of hospitals worldwide.

## COMMENTS TO AUTHORS

I suggest this paper should be accepted after minor revision. A few minor revision are list below.

- (1) Was the research object also given to other treatment after surgical operation treatment, such as: chemotherapy, interventional therapy, biological target therapy? Please explain in this article.
- (2) Please provide relevant pictures of polymorphisms of glutathione S-transferase genes .
