COMMENTS TO AUTHORS

Why did you not perform MRI? Would you please change the following sentences in the discussion:

1. The indications for surgery of hepatic hemangiomas are severe symptoms , uncertain diagnosis, and complications. The right indications for surgery for liver hemangiomas are Kasabach-Merritt syndrome, symptoms of organ compression that have been well established excluding other diseases, and traumatic or spontaneous rupture. These last two possibilities are very rare. On the opposite diagnosis could be established in almost all the cases and diagnostic failure became very rare. For this sentence please cite Ann Hepatol. 2014 Jul-Aug;13(4):327-39. 2. Some authors have suggested that all giant liver hemangiomas and superficial subcapsular lesions, which could be prone to a traumatic rupture, should be resected[12]. This sentence is actually no more accepted so please remove it. Any increased risk concern the location or the dimension of the hemangiomas in the liver. Please cite the previous reference.
