COMMENTS TO AUTHORS

Manuscript is a commentary about another work of Matsumoto et al about the role of omega 3 parenteral lipid emulsion in preventing or reversing PNALD. The authors highlight the fact of the persistence of hepatic fibrosis despite of the normalization of inflammatory and cholestasis parameters. They also marked the use of lower doses of lipid as a factor of confusion in these findings. I would only add that in the original work is not clear the criteria to include liver in the graft (all patients have analytical signs of hepatopathy, they don't performed hepatic biopsy to most of patients and all of them reverted these disorders with omega 3). However rest of comments are appropriate according current knowledge about this topic
