COMMENTS TO AUTHORS

The study is well designed and very interesting. In this study, the roles of NF-KB and angiotensin II-1 receptor in the pathogenesis of NAFLD are investigated. There are 36 rat(18 NAFLD and 18 control) was included in this study. The authors found that the hepatic NF-KB in the model group was significantly activated, the expression in the intervention group was lower than the model group of the same period, while higher than the normal group. And the expression of AT1R mRNA in the model group was significantly higher than the normal group. They concluded that the NF-KB activity enhanced, the inhibition of its activity might reduce the AT1R mRNA expression in the NAFLD rat liver tissues. Some minor suggestions: 1 The text need some editing according to the journal's instructions. 2 The discussion is good, but some more recent references should be added.
