COMMENTS TO AUTHORS

Interesting review, dealing with the important issues of Screening of CRC to date. However there are some minor issues which should be addressed. The article focuses mainly on US studies and Italian trials. It would be interesting to include some of the Asian data on the topic. Further I would propose to include an overview of the ongoing trials on the subject. Besides this, new technologies should be addressed in more detail. Finally text structure and english grammar should be checked by a native speaker, as some sentences appear to be difficult to understand.

COMMENTS TO AUTHORS

1 The authors are suggested to present the factors that result in the increased risk of familial CRC development, including genetic (familial polyposis), customary life-style and circumstances. 2 The authors introduced several modalities for CRC screening. They are suggested to discuss the advantages and disadvantages of these methods in application, including successful rates, positive rates and accuracy. 3 An overview of this population is necessary, such as CRC-related mortality. 4 Please correct typo and edit errors. Grammatical errors exist.

COMMENTS TO AUTHORS

The authors are focus of the methods for detecting colorectal cancer and strategies for colorectal cancer screening. The paper is clearly written and contains valuable information. However, there are some typos and grammatical errors in the text. -ABSTRACT: Sigmoidoscopy, alone or in addition to FOBT, -ABSTRACT: The choice of test depends on local healthy policy -INTRODUCTION: the adenomatous and amartomatous polyposis syndromes, -INTRODUCTION: the Authors demonstrated that -FAMILIAL CRC SCREENING: WHEN TO DO: The majority of screening recommendation take into consideration the so called anticipation phenomenon suggesting that CRC arises 10 years earlier in FDR of a CRC patient than in subjects without a family history (28, 29). -Faecal DNA test: Remains uncertainty if ADA can be reliably detected. -Screening colonoscopy: A so low acceptability of colonoscopy in FDRs may have several reasons, such as an insufficient information about the usefulness of a colonoscopy, including the possibility to detect and remove preneoplastic lesions, which really allows to prevent CRC in contrast to other screening tests. -Faecal DNA test: More information should be given also about the few risk associated with colonoscopy and the possibility to perform the exam under sedation to reduce discomfort.
