COMMENTS TO AUTHORS

A major problem in connection with liver transplantations is the formation of thrombotic complications. The present paper reviews and discusses the numerous risk factors that may contribute to thrombotic events in liver transplantations, and how and where in the blood vessel system the thrombotic events may take place. The authors also discuss presages of thrombotic events and emphasize the importance of identifying possible predictors of vascular thrombosis rapidly. The paper moreover contains an interesting chapter about pharmacologic thromboprophylaxis following liver transplantation. Conclusion: This is an interesting article. It presents valuable and useful information for people working in the field. Although the article is well written the authors should include a list in which the numerous acronyms are explained.
