COMMENTS TO AUTHORS

authors evaluated the role of hepatosteatosis/NASH as a risk factor in patients who underwent liver surgery for primer liver tumor (hcc and ccc) and liver metastases (colorectal or other tumors). Although the idea was good, patients with steatosis and/or fibrosis were very few and even, there was no patient with nash. I suggest that the data can be published as letter to editor after minor corrections as pointed in attached file.

COMMENTS TO AUTHORS

Frankly speaking, this manuscript seems less originality. However, the contents would give significant information. The language is generally good, apart from some grammar errors. Thus, I do not hesitate that this would be acceptable after a minor revision.
