## COMMENTS TO AUTHORS

Paquissi et al. reported primary adenocarcinoma of the 3rd/4th portions of the duodenum in 40-year-old man. Upper GI endoscopy and colonoscopy were normal, but the polypoid lesions with low-flow bleeding were observed by video capsule endoscopy. Minor comments 1. In this case, blood test revealed hypochromic anemia with anisocytosis and microcytosis. Although this is likely to result from GI bleeding and iron deficiency anemia (not the patient's underlying disease), the authors should show data (e.g., CBC, blood smear, iron study, occult blood) that can explain or support abnormal blood test. 2. Please clearly label structures in Figs. 1 and 3, and add scale bars and brief description of histological technique in Fig. 3.
