COMMENTS TO AUTHORS

This is a succinct report on a particular feature of pancreatic paragangliomas (prominent draining vessels) that may be of preoperative diagnostic use. Comments: - since paraganglioma in the pancreas is such a rare finding, the authors should consider providing a few more details about the histopathological diagnosis: (i) what was the exact location of the tumour in the pancreatic head? From figure 2A it may seem that there was extension into the duodenum. What was the relationship to the superior mesenteric vein/portal vein or other major vessels? (ii) S100 immunohistochemical staining is reported to be positive, but did it show a pattern characteristic of sustentacular cells? A picture would be informative. (iii) Was tyrosine hydroxylase stained for? - Were there any histological findings that indicated the possible behaviour of this paraganglioma? How long was follow-up? Was there any tumour recurrence/metastasis? - The legend to figure 1 only indicates the type of imaging, but does not provide any information regarding the findings. A brief description together with the use of clear annotations would be most helpful to the readers. - Legend to figure 1: it is 'arterial' phase, not 'artery'.

COMMENTS TO AUTHORS

The authors of this manuscript present a case of a rare disease, pancreatic paraganglioma that was surgically resected following preoperative diagnosis of a pancreatic neuroendocrine tumour. They found that abundant draining vessels that were clearly visualized by endoscopic ultrasonography were key findings to obtain a correct preoperative diagnosis of pancreatic paraganglioma. English writing is good and it is worth for publication in WJG after minor revisions listed below. Minor comments: 1. Provide D.O.I. and PMID in every reference as Instructions to Authors of WJG indicated.

COMMENTS TO AUTHORS

A logical inference, but needs more studies for a definite conclusion regarding the finding of venous vasculature being characteristic.

COMMENTS TO AUTHORS

The abstract, introduction is appropriate. There is still room for improvement in deepening consideration of "draining vessels", but consider all the various factors together, it is worth for publication in WJG.
