COMMENTS TO AUTHORS

This is an interesting manuscript about a porcine hepatocirrhosis portal hypertension model. In this study, the authors explored the feasibility and safety of establishing a porcine hepatocirrhosis portal hypertension model by hepatic arterial perfusion with 80% alcohol. About 21 healthy pigs were randomly divided into three different groups and three different control groups. The authors found that It is feasible to establish an animal model of hepatocirrhosis portal hypertension by hepatic arterial perfusion with 80% alcohol, but the safety depends on a suitable perfusion dose. Some revisions needed before publication. 1 The manuscript need to be edited and proof by a Native English speaker. 2 Tables and figures are interesting. 3 The discussion should be reorganized with more recent references.
