COMMENTS TO AUTHORS

First of all, Authors correctly state that..... FLI was not more effective than WC in the discrimination of NAFLD.... thus the title must contain this concept, mainly at the light that NAFLD is strictly linked to visceral adiposity, a main criterion of the MS. Obviously, Authors should discuss at large this point, quoting one of the most recent papers dealing with this often overlooked aspect that is central/abdominal fat excess determining IR, i.e., World J Gastroenterol. 2013 Jun 14;19(22):3375-84. doi: 10.3748/wjg.v19.i22.3375. What about non-alcoholic fatty liver disease as a new criterion to define metabolic syndrome? Authors should be congratulated for having performed a very appropriate statistics.

COMMENTS TO AUTHORS

The authors developed new criteria for on-alcoholic fatty liver disease using fatty liver index. This would be perhaps beneficial to the clinical managements.
