COMMENTS TO AUTHORS

The paper presents the influence of antibiotic-regimens on ICU-mortality. It underlines the successful implementation of early-goal-directed therapy in patients treated in ICU. The topic is interesting, especially considering the rate of mortality in these patients and financial burden. General comments: 1. The Authors should explain why they focused on subgroups patients with liver cirrhosis. However, in patients with diabetes mellitus or pulmonary diseases that acquire infection the mortality rate also increase. This raises the question: why did patients with liver cirrhosis constitute a group of special interest? 2. In the section Characteristics and Infection (if not be better Characteristics of Infection) Gram-positive and Gram-negative isolates should be listed. 3. It would be more readable to place data concerning the mortality in a table. 4. What does the term "chronic liver disease" include. It is not clear whether the patients with viral infection of liver are included in this group or, it is a separate group. It requires an explanation. Does this group include the subjects with toxic (alcoholic) or autoimmune liver damage? 5. Were the patients with bacterial spontaneous peritonitis present among patients with liver cirrhosis? If yes, this group requires the separate
