COMMENTS TO AUTHORS

The case report of "Henoch-Schonlein purport: from vasculitis induces mucosal ischemia to intestinal perforation" by Lerkvaleekul et al describes a case of a young boy with HSP who developed intestinal perforation that was not initially picked up on standard imaging as well as well-into his steroid treatment. This is a very nice case report and review of the literature to remind pediatricians and gastroenterologists of possible complications from a relatively common disease. The authors did a very nice job of presenting all of the pertinent information from the case. Additionally, the discussion was well-balanced and provided needed information. The table and figures were also appropriate for the case and manuscript.

COMMENTS TO AUTHORS

In this case report study, the authors described the treatment procedure of a case who was diagnosed with HSP and had a HSP-associated intestinal perforation, which is rare in clinics. Although this is an interesting case, problems are present in the manuscript. 1.The title should be revised, so that the study type (case report) could be stated. 2.The admission date and inpatient unit should be stated. 3.The results of physical examination and laboratory examination (such as blood routine, urine routine, stool routine and coagulation function, etc) should be described detailly in the first day of admission, so that we could diagnosed the patient as HSP. 4.The results of examination during the course of disease could be summarized as a table, so that we can understand the course of disease well. 5.Based on the pathological result (granulation tissue and fibrosis) and Figure 1, we can infer that the perforation was present for a long time before found. Therefore, how to avoid the occurrence of perforation and how to manage the complication timely should be emphasize in the part of discussion.

COMMENTS TO AUTHORS

This case report of "Henoch-Schonlein purpura: from vasculitis induces mucosal ischemia to intestinal perforation" by Lerkvaleekul et al describes a case of a young boy with HSP who developed intestinal perforation. This is a very interesting case report and describes a rare case. The overall structure of the manuscript is complete and the language of the manuscript reach the standard of publishing. The case characteristics are clearly presented and discussed in the manuscript and figures. The manuscript is conform to the academic rules and cite all important, relevant and timely references. Even if the manuscript doesn't present important new methods or novel findings, it reminds pediatricians and gastroenterologists that close observation and frequent physical examination are essential for the early detection of bowel ischemia as possible cause of bowel perforation. The manuscript is concise, clear, comprehensive, and convincing.
