### COMMENTS TO AUTHORS

The authors present an interesting case of a 77 year-old man with a fatal duodenal diverticular bleeding. Cytomegalic cells with intranuclear inclusions were found on post mortem histopathological examination of the duodenal diverticulum, allowing the diagnosis of CMV infection. CMV infection of the gastrointestinal tract is frequently found in immunocompromised patients and it is known that can lead to gastrointestinal bleeding, especially in patients with AIDS. Although the commonest site of involvement is the colon, this case highlights the rare condition of massive gastrointestinal bleeding due to CMV disease of the small bowel. The case is well-described and an exhaustive review of the literature has been done.
