COMMENTS TO AUTHORS

The fact that Gastric polyps become a major clinical problem because of the high malignant transformation is well and clearly presented in the abstract. As well, the contribution of HP eradication is clearly presented but I shall mention that the statement that gastric hyperplastic polyps may regress after the treatment of the bacteria should not be written in the abstract because of the „May regress” and its place is only in the Main text. The introduction is not based on the latest statistics or the latest articles in the field, but bibliographic database contains statistics on large populations, so these aspects on the novelty of the articles are compensated. The pathophysiological and clinical aspects of Gastric Hyperplastic Polyps is a large domain but the treatment is presented in detail including all indications of attained pathology.

COMMENTS TO AUTHORS

This article showed that the pathophysiological and clinical aspects of gastric hyperplastic polyps (GHP). I agree with your opinion that the needs of H. pylori eradication and relatively small size polypectomy (larger than 5 mm) for treatment of GHP. The manuscript is written very well, however, there are some points that author should clarify. First, the description of the treatment is too long and complicated. It is necessary to make the explanation more concise. I recommend that you create figure or table for explain of treatment part. Second, the clinical factors predicting for neoplastic transformation of GHP is important point. In this article, you only mentioned about the polyp size for predict of neoplastic transformation. You should explain the other factors related with neoplastic transformation.
