COMMENTS TO AUTHORS

In this manuscript, Rossano et al describe high rate of imaging evolution and developing 8.3% of alert findings during follow-up IPMN. This contains novel findings and may be acceptable, if the following points would be clarified. Major point I have no special recommendation to Authors, but there is just one point that should be clarified. The authors evaluated 72 patients and total of 343 cysts. Are there any cysts which had worrisome features and/ or high risk stigmata ab initio. Or did the authors exclude these patients? Minor points In MATERIALS AND METHODS section (Study population), I found it to be difficult to understand. This is following 'Excluded were fifty subjects showing, ~~, bd-IPMN- or mixed-IPMN-like lesions with suspicious signs ab initio,.

COMMENTS TO AUTHORS

Dear Authors, Your study "Evolution of incidental branch-duct intraductal papillary mucinous neoplasm of the pancreas over follow-up: a study with Magnetic resonance imaging cholangiopancreatography" is very interesting and based on rigorous academic standards. Some grammatical / spelling errors in the text need correction.
