COMMENTS TO AUTHORS

A large retrospective study that you list the many drawbacks but nevertheless it is very interesting data. It is the largest single center study on this topic and it does gain strength from this.

COMMENTS TO AUTHORS

1) The authors performed a retrospective single-centre case controlled study of consecutive patients listed for LT over 12 years . The study result showed that Clinically apparent portal hypertension is common in patients with polycystic liver disease, however it appears that this finding does not appear to affect wait list or post-transplantation outcomes in the short-term. 2) The clinical data is true and reliable, the conclusion is credible. The respective study is important reference value to treat such patients with PCLD for clinical doctors. I suggest that the manuscript can be published in the form of retrospective study in World J Gastroenterology.

COMMENTS TO AUTHORS

Large cohort one-center retrospective study in patients with PCLD listed for liver transpantaton.Despite the limitations of the study related with its retrospective form it provides intersting and clinically usefull data.
