COMMENTS TO AUTHORS

This an interesting manuscript. In this manuscript, the effect of targeted therapy of 64-slice spiral CT combined with cryoablation for liver cancer was observed. A total of 124 patients were enrolled into this study. According to the use of dual-slice spiral CT or 64-slice spiral CT as a guide technology, patients were divided into two groups: dual-slice group and 64-slice group. All of Patients were accepted targeted therapy by argon-helium superconducting surgery system. The guided scan times of the two groups was recorded and compared. The authors found that the treatment effect and therapeutic efficacy in the dual-slice group were lower than the 64-slice group at four weeks post-treatment. Moreover, pleural effusion and intraperitoneal hemorrhage occurred in patients in the dual-slice group, while no complications occurred in the 64-slice group. 64-slice spiral CT applied with cryoablation in targeted therapy for liver cancer can achieve a safe and effective freezing treatment, so it is worth being used reasonably. 1 The English of the manuscript should be revised. 2 The figures and tables are good, however, the tables should be checked again. 3 Results are interesting and well discussed. 4 References list is updated.
