SPECIFIC COMMENTS TO AUTHORS

The authors of this study aimed to evaluate the safety, efficacy and cosmetic results of TUE for the management of HD in two-stage laparoscopic assisted pull-through, by a retrospective comparison with CAE. To do this, they reviewed 532 patients who underwent enterostomy and two-stage laparoscopic assisted pull-through for HD with stoma closure at their institute. Results of their study revealed no difference between groups with respect to gender, age at enterostomy, weight and clinical type ($P > 0.05$). In addition, conversion to an open technique was not needed. The authors concluded that a transumbilical enterostomy is a safe and feasible method for HD, offering easier stoma care and a better cosmetic result, and that the staged enterostomy and two-stage laparoscopy-assisted pull-through achieved a similar cosmetic result as one-stage laparoscopy. This is a concise and thorough study. With easier stoma care and an improved cosmetic result, the benefits of TUE are clear.

1 Title. Suitable 2 Abstract. Suitable 3 Key words. Suitable 4 Background. One-session treatment methods should be mentioned such as Transanal pullthrough 5 Methods. Suitable 6 Results. Which type of enterostomy did the prolapse develop? Should be explained. 7 Discussion. Should be compared with single session methods. How is evaluated umbilicus loss? Should be explained. 8 Illustrations and tables. Suitable 9 Biostatistics. No required 10 Units. Yes. 11 References. Suitable 12 Quality of manuscript organization and presentation. Suitable 13 Research methods and reporting. This manuscript is Clinical Trials. Suitable 14 Ethics statements. This study was approved by the Ethics Committee of Union Hospital
