SPECIFIC COMMENTS TO AUTHORS

In this review, the author introduces the development history of iron death, combs the mechanism of iron death in liver diseases, and puts forward unique views on the future prospects of iron death in the treatment of liver diseases. I think this review is very interesting, because iron death, as a hot research field, has great prospects for clinical transformation, and liver disease is a very important disease, so this paper has high practical value. However, there are still some parts that need to be modified. Question 1: When elaborating the regulatory mechanism of endogenous and exogenous regulators on ferroptosis, the author should further discuss the two main pathways that cause ferroptosis: "exogenous/transporter dependent pathway" and "endogenous/enzyme regulated pathway". Question 2: If the key steps of GelNB synthesis process are highlighted, especially the steps to achieve the strong adhesion of the material, the article will have more reference value. The authors are suggested to modify as appropriate.

SPECIFIC COMMENTS TO AUTHORS

The “iron as a therapeutic target in chronic liver diseases”. It is interesting, but there are some comments for the authors. 1. This is the brief review, however, I am not sure whether it is necessary over 500 references. 2. The structure of the review is not regular, no abstract is presented. 3. I want to know the detail of Ischemia-reperfusion injury (IRI), are they liver diseases. 4. Whether the authors can further describe sickle cell liver disease (SCD). 5. Covid-19 part can be deleted. 6. “It is well documented, that iron in the liver is a double-edged sword.” Actually, I think authors can add the section for the challenges of iron in the liver diseases. 7. Table 1 is too easy. 8. How to classify so many liver diseases.

SPECIFIC COMMENTS TO AUTHORS

Over 500 references , which is not common.
