**COMMENTS TO AUTHORS**

This is an interesting review of a novel clinical entity, pancreatic steatosis. The authors discuss in detail the modalities used for the diagnosis of the disorder. However, they should expand the section on the sequelae of pancreatic steatosis. They should discuss if there are associations with insulin resistance or impaired insulin secretion. Indeed, the finding that pancreatic steatosis is associated with the metabolic syndrome but not type 2 diabetes mellitus is rather peculiar, given the strong relationship between the latter two conditions.

**COMMENTS TO AUTHORS**

Pezzilli et al have written a very good review of the topic of pancreatic steatosis. I find no errors and significant omissions. I think this article can be published in its present form and will be very useful to your readers. If the authors have any interesting speculations about the possible reasons why obese type 2 diabetics do not seem to have the same degree of pancreatic steatosis as non-diabetic obese subjects, it would be of interest to add that to the article.
