## COMMENTS TO AUTHORS

In the present review, the author described the glycemic control indicators during pregnancy. The topic of this review is important and interesting. It would be better to add the description about diagnostic thresholds of these indicators for gestational diabetes and their impact on pregnancy outcomes. minor Page 7 line 12: bold: DEFINITION OF GESTATIONAL DIABETES (GDM)

## COMMENTS TO AUTHORS

This is an interesting review about indicators of glycemic control of women with GDM and overt diabetes mellitus. Authors conclude that it is insufficient during pregnancy to use HbA1c as an indicator of glycemic control and that glycemic control using GA is required. In addition, in the Conclusion section, authors state that the goal of management of abnormal glucose metabolism during pregnancy should be to maintain GA within the normal range (15.7% or less). Doing so will decrease the incidence of perinatal complications of mothers and infants and will contribute to better health of the next generation. Comments A clear objective about the purpose of the review is needed in the Abstract and text The text includes some underlined words giving the impression that the current manuscript is an unfinished draft. The review is focused mainly in the theorist aspects of the glycemia changes during pregnancy; however, data from clinical studies are scarce. Thus, the conclusion is not supported by data provided in the review.

## COMMENTS TO AUTHORS

The review by Hashimoto & Koga is a well-write manuscript on a hot-diabetic topic. I recommend only a aesthetic detail, authors would distinguish between paper section and subsection with titles and subtitle, for instance: The section Measure of blood glucose include subsections, self-monitoring of blood glucose, continuous glucose monitoring. In my opinion this review should be publish in the WJD
