COMMENTS TO AUTHORS

The review entitled: "Limited joint mobility syndrome in diabetes mellitus: a mini review" is an interesting article about limited joint mobility syndrome in diabetes mellitus that is an underreported complication, associated with micro and macrovascular complications. From a clinical perspective, a good glycemic control and daily exercising are the main and the base of prevention. Treatment options include symptomatic therapies and surgical correction. Medical treatment targeting the formation of glycosylated endproducts accumulating on collagen and other connective tissues are unsuccessful for this complication. The review is complete and analyzes all the aspects of this forgotten complication of diabetes mellitus.

COMMENTS TO AUTHORS

Interesting article. Would add more to pathogenesis section and add references in end of that section for correlation between LJMS and glycemic control since that is really the most important part of this as well as the associations with nephropathy/neuropathy etc. Would strengthen that as well
