COMMENTS TO AUTHORS

In the editorial submitted to the journal, authors discuss the potential effect of PCSK9 inhibitors on glucose metabolism and risk of incident diabetes. The issue is relevant since clinical trials and experimental data from animal models have shown conflicting results of these drugs on the risk of DM. The text is clear and well-written. The figure is clear and self-explanatory. Among the reasons raised by the authors to explain the neutral diabetogenic effects of PCSK9 inhibitors observed in clinical trials, it would be worth to mention that the addition of this drugs to statins in the trials may partially mask effects on glucose metabolism if there are mechanisms of action shared between the two classes. Furthermore, I have only minor observations to be considered: Page 5, paragraph 1: The numeral 3 is being used. Consider spelling out the number. Page 6 last paragraph: I suggest adding to the text the registration number of each trial according to Clinicaltrials.gov

COMMENTS TO AUTHORS

The present review highlights a promising target with significant importance in treatment of DM and dyslipidemia. However, I suggest inclusion of a diagram the explain the regulatory effect of PCSK9 on LDL-c receptors and the outcome of its targeting with drugs.

COMMENTS TO AUTHORS

Important review and proposal of mechanism for new class lipid lowering medicine on glucose metabolism. The authors pointed out the possibility of 'counterbalanced' effect of PCSK9 inhibition on glucose homeostasis, but there are other possibilities, such as no significant effects rather than dual effect on glucose metabolism when PCSK9 is inhibited. If authors make a table for summary of known animal data, known human data, speculations and/or future studies for the theme, readers can obtain unbiased, organized knowledge.
