SPECIFIC COMMENTS TO AUTHORS

Laparoscopic tumor resection is a common surgical treatment method for liver metastasis of colorectal cancer in clinical practice; it reduces the tumor burden of patients by removing liver metastases and has the advantages of a small wound, less bleeding, and quick recovery. The surgical method is in the abdomen of the patient, so it will affect the digestive function after surgery. And early nursing and psychological intervention are necessary. In this study, the authors observed the effect of enhanced recovery after surgical nursing combined with mental health education on postoperative recovery, and mental health of patients undergoing laparoscopic resection of liver metastases of colorectal cancer. The study is overall well designed and the results are interesting. The manuscript is well written. After a minor revision, this manuscript can be accepted for publication. Comments: 1. There are some minor language polishing which should be corrected. 2. The title is too long, please short it. 3. A short background

SPECIFIC COMMENTS TO AUTHORS

This is an interesting study of the surgical nursing and mental health education for postoperative recovery of patients undergoing laparoscopic resection of liver metastases of colorectal cancer. The findings are well discussed. Minor comments: 1. The abstract is too long, please only keep the key methods and results. 2. Figures and tables should be moved to the end of the text. 3. The references list should be edited according to the journal's guideline.
