COMMENTS TO AUTHORS

To Author Transanal endoscopic microsurgery (TEM) is a minimally invasive technique developed for the resection of rectal neoplasms. However, it is somehow provocative to be considered published in the World Journal of Gastroenterology. In addition, the rectal perforation as stated in the manuscript has no a pathological support.

COMMENTS TO AUTHORS

very interesting case report of something observed not so rarely, even though not so evident. Some minor changes are anyway mandatory: 1. a 15 cm TEM rectoscope does not exist. Either you are using the TEO 15 cm (Karl Storz) or the TEM 12 cm (Richard Wolf). Please clarify 2. please specify also which insufflator you were using (Storz or Wolf) and which insufflation speed you were using too, not only the 12 mmHg internal pressure 3. please specify how long did the procedure last 4. did you use preoperative antibiotics and which? 5. please clarify more in details which was the post-op course of the patient, and in particular: - when was the patient extubated - which antibiotic was used and for how long - which was the course of bowel movements - when was the patient allowed liquid and solid diet - if the patient had fever and for how long 6. please comment how do you explain that an anterior wall opening in the rectum justifies a pneumo-retroperitoneum and not a pneumoperitoneum.

COMMENTS TO AUTHORS

Complication of retroperitoneal, intraperitoneal and subcutaneous emphysema after CO₂ insufflation is not a rare complication.
