COMMENTS TO AUTHORS

Thank you for the opportunity to review the manuscript that provides a case of osteosarcoma of the mesentery. I reviewed your manuscript with sincerity and had a decision as below. The following comments/suggestions arose during my review. 1. Authors should provide the information whether this lesion is a primary or metastatic in detail. For example, the comorbidities, a history of pathological fracture of the bone or the image of the whole body surveillance such as FDG-PET etc. 2. The description of the disease spreading is not enough. Probably, this huge lesion might have a distant metastasis except for lymph nodes which authors described. 3. Laboratory data are recommended to be shown with the table and real numeric value. 4. In the discussion of the differential diagnosis of the ESOS, if the distinguish ESOS from other diseases is difficult, authors should write the fact that D/D depends on the histopathological examination of surgical materials.

COMMENTS TO AUTHORS

Good write up of a rare cause of intestinal obstruction. Was the intestinal obstruction due to extra-luminal compression of the caecum by the tumor or direct obstruction of the resected ileum due to tumor obliteration of the ileal lumen? Any air-fluid levels on the radiological investigations done? how did you establish that the patient was disease free three years later?

COMMENTS TO AUTHORS

This is a well written case report. Please provide the data of general incidence of osteosarcoma as well ESOS. How was it confirmed that the patient did not have any metastases to lungs or bones? Please describe how the patient was followed-up after surgery?
