COMMENTS TO AUTHORS

1. In the 13 lines of second paragraph, 6 pages, author described that "However, the surface epithelium had no precancerous or cancerous lesions, suggesting that this lesion was metastatic." However, Borrmann type 4 gastric cancer infiltrates the submucosal layer. Hence, It is difficult to find cancer cells in the biopsy samples obtained from gastrofiberscopy. Therefore, the above statement was wrong. 2. There are some expression defects in the English of this manuscript which need further improvement.

COMMENTS TO AUTHORS

Interesting case-report. Authors should address and discuss the need for operation versus just chemotherapy or even radiation to control local symptoms and or bleeding in the case of lung cancer metastases to the stomach.

COMMENTS TO AUTHORS

This is a nicely written and interesting case-report. Although this is not the first reported case of gastric metastasis from lung cancer, authors adequately cite recently published case reports. I think it would be also important to discuss the role of surgery as an individualized therapeutic option (i.e. control of symptoms or complications such as bleeding). In addition, if gastric metastasis is the sole site of metastatic disease, resection with curative intend could be discussed and performed.
