COMMENTS TO AUTHORS

Authors reported their successful challenge to create a vascularized, ready-to-use patch by an extremely feasible method of subcutaneous implantation of polyvinyl tubes. I believe that their technique will contribute to therapeutic development for the treatment of acute tissue injuries. The only one regrettable point is that they did not present a case where the implanted patch eventually improved the repair of injured tissues. I strongly hope that authors will prove the efficacy of their patches in their future works.

Minor concerns 1) Page 8, line 13-14, "While the day 4-7 bladder tissues were too delicate to handle the day 14 tissue was strong enough to be obtained as an integral bladder." should be rewritten as "While the day 4-7 bladder tissues were too delicate to handle, the day 14 tissue was strong enough to be obtained as an integral bladder." by adding a comma before "the day 14". 2) Page 10, line 1-2, "Because the tissue patch was found to be a dynamic tissue between days 4-42 after implantation of the inert body it was important to determine the growing edge of the tissue" should be rewritten as "Because the tissue patch was found to be a dynamic tissue between days 4-42 after implantation of the inert body, it was important to determine the growing edge of the tissue" by adding a comma before "it was important". 3) In the legend of

Fig. 3, “bladder like” should be rewritten as “bladder-like” by adding a hyphen between bladder and like.
