## COMMENTS TO AUTHORS

-Probably in case of large aneurysm in absence of liver cirrhosis and portal hypertension, which is the most common condition associated with, the best treatment could be open surgery (ligation of splenic artery, resection/repair or resection+splenectomy). -A more detailed description of open treatment may be useful -The metallic stent shown in the picture is not covered and should not be used that one in such situation. Please, make a comment on this. Minor english revision.

### COMMENTS TO AUTHORS

The case is well presented though the language needs to be refined a little. It would be prudent if the authors elaborate a bit on the treatment options including operative mortality (elective vs. emergent) and success rates of radiological interventions.
