COMMENTS TO AUTHORS

The authors report a case of spleen injury after DE for the first time and underscore the importance of careful clinical observation for a patient, especially complaining of abdominal pain, after endoscopic examination in order to recognize and treat this potentially life-threatening complication as soon as possible. Thus, this report is very unique and instructive for many kinds of clinicians including endoscopists. Please make some explanations for questions as below. 1) Can you estimate the findings of the CT scan for your patient according to American Association of Surgeons for Trauma Splenic Injury Grading Scale ? 2) Can you comment about the possibility of non-operative management including angiographic embolization for your patient, instead of splenectomy ? 3) Why did your patient undergo a segmental ileal resection, even though bleeding from ileal branched angiodectasia (type 1b) seemed to have been controlled by APC treatment ?

COMMENTS TO AUTHORS

Good report of this complication as a similarity with description during conventionnel coloscopy. No special comments

COMMENTS TO AUTHORS

It is important for reader to know the size of the enteroscope (diagnostic or therapeutic) and also the duration of deep endoscopy, Previous abdominal surgery in the patient?????

COMMENTS TO AUTHORS

This is the first case report of splenic rupture following deep enteroscopy. However, the author could not explain the exact mechanism why a rare complication occurred only in this patient. We merely only understood that enteroscopy had same risk of colonoscopy and may cause splenic rupture,
