		<input type="checkbox"/> No records	<input type="checkbox"/> Major revision

**COMMENTS TO AUTHORS**

This is a case report written in the format of a Letter to the Editor. The case report is on a 17-year old female who was diagnosed to suffer from primary intestinal lymphangiectasia. In spite of enteral nutrition which was based on hyper-proteic, vitamin, low fat and medium-chain triglyceride supplementation, the patient's liver fibrosis doubled on elastography. My comments on this paper are: (1) The English needs to improve. The paper contains a lot of grammatical mistakes. (2) There is no information on whether other causes which led to liver fibrosis had been ruled out. (3) This patient showed improvements both clinically and serologically (normalization of aminotransferase and gamma-glutamyltransferase). I do not understand why the liver stiffness became double. Is there a good explanation by the authors?
