## COMMENTS TO AUTHORS

Editorial manuscript `Hepatic metastatic disease in pediatric solid tumors` by Fernandez-Pineda, et al. is well elaborated, well written paper highlighting relevant information in the field of children oncology; is concise, very interesting and informative review of sufficient literature data, supporting proper explanations and conclusions. Minor discretionary revisions might be suggested to consider (which Authors can choose to ignore): to discuss screening approaches, focus on opportunities for personalised treatments; to formulate clear limitations and prospects for future studies. Including additional images (ultrasound and MRI as appropriate modality for children) and possibly generalized algorithm for management of hepatic metastatic disease in children would be appreciated.

## COMMENTS TO AUTHORS

A very well - written and comprehensive paper. Rich in literature data, with a symmetric distribution of its content and precise description of the separate sections, it clearly supports the major topic and its conclusions. Apparently, the authors are knowledgeable about this field. Minor remarks: 1. Title: Hepatic metastatic disease in pediatric solid tumors. When the authors use the term pediatric, they do not refer only to childhood, but to children and adolescents younger than 20 years of age. Wouldn't be more representative another term instead of pediatric? e.g. Hepatic metastatic disease in childhood and adolescent solid tumors. 2. On page 14 of the manuscript, "In conclusion, a role exists for complete surgical resection of residual metastases ..." Do the author mean exists and not exit?
