COMMENTS TO AUTHORS

This is a timely review. Only minor points: 1) a table summarizing all drugs will certainly help the reader; it should also provide management summaries; 2) immunosuppressive therapies often reactivate tuberculosis; antitubercular agents are also hepatotoxic and could be considered for inclusion in the review; 3) I noticed several typos.

COMMENTS TO AUTHORS

This is a well thought out and well written review of the subject of hepatic drug-related injury in IBD. It is comprehensive, accurate and I have no comments to make. I suggest to accept as is.

COMMENTS TO AUTHORS

This manuscript summarized the hepatic injuries related to non-steroids medications treating idiopathic inflammatory bowel disease. It is a well written and comprehensive review. Several comments: 1. A table is advised to summarize the major clinical and pathological features of hepatic injury. 2. Suggest to change the title, because this manuscript only discussed the non-steroids medication induced hepatic injury. 3. Authors should provide a scientific (or empirical) reason (s) that patient should be checked for liver function as suggested when patient receives AZA and 6-MP.

COMMENTS TO AUTHORS

Although the authors stated in the introduction part that "This review evaluates the hepatobiliary complications, mainly Drug Induced Liver Injury (DILI) of currently available non-steroid based IBD therapies", it would be useful for the readers to know the hepatobiliary complications of the two most commonly used antibiotics in the treatment of IBD namely metronidazole (and ornidazole) and ciprofloxacin. The authors should also give emphasis to the hepatic complications of the drugs used for TBC prophylaxis of reactivation (e.g. isoniazide). Finally a table summarizing all the hepatic complications of the various drugs used in the treatment of IBD would also be useful.
