## COMMENTS TO AUTHORS

This case report describe a case of Crigler Najjar syndrome Type 2 diagnosed during pregnancy, that was recognized as a stressful condition in which the bilirubin levels can increase. The treatment with phenobarbitone, known to be potentially teratogenic, must necessarily be at low dose; the levels of bilirubin were monitored in order to avoid neurological damage in the fetus. Although the study appears well conducted, the report of cases of maternal Crigler-Najjar syndrome type 2 in pregnancy is not a novelty, and some cases are present in the literature. This paper does not bring new information, but the Authors opportunely reassume standard guidelines for the management of pregnancy in Crigler Najjar syndrome type 2.

## COMMENTS TO AUTHORS

A nice case presentation that I recommend its publication. I have only two remarks: 1. The authors should clearly describe whether they have performed a liver and gallbladder scan during pregnancy to rule out other etiologies for increased bilirubin level. 2. The sequelae of hyperbilirubinemia during pregnancy (not the neonatal period) is not well discussed. This should be adequately added to the manuscript.

## COMMENTS TO AUTHORS

Short, clear and well written manuscript. A rare disease that should be of interest to the Journal readers.
