COMMENTS TO AUTHORS

The fact that BCS has different etiologies between the East and the West is known. However, the core issue of BCS physiopathology is that chronic hepatic congestion leads to sinusoidal thrombosis and strain, which promote hepatic fibrosis, whatever is the etiology (Simonetto et al, Hepatology 2015). This is the leading reason suggesting an update of both clinical classification and timing of treatment, as recently reported. Overall, a new classification between IVC obstruction and hepatic vein thrombosis would not seem to be relevant in clinical practice.

COMMENTS TO AUTHORS

BCS is defined as hepatic venous outflow tract obstruction, independent of the level or mechanism of obstruction. I think the article will raise discussions and perhaps a better classification and management.
