COMMENTS TO AUTHORS

This manuscript presents a rare case of pseudoaneurysm of hepatic artery. The management of the case is informative, and useful for the readers. The pseudoaneurysm was as diagnosed as Klatskin's tumor. The CT showed a low density area that suggested a tumor in the hilar part of the liver. Was magnetic resonance cholangiopancreatography performed? It is expected that MRCP shows the pseudoaneurysm in anatomical setting. Was ultrasonography performed? It is expected that ultrasonography shows the pseudoaneurysm in detail. It seemed that the liver damage was due to the obstruction of bile duct. Was the obstruction recovered? Did the liver function normalize after the treatment? Figure 3, 4: Scale bars are absent.

COMMENTS TO AUTHORS

The abstract is quite concise, showing main important features discussed in the article. Case presentation is adequate: please specify if bilirubina normalized after biliary stenting. Role of imaging should be emphasized in the discussion; enhanced CT acquisitions and MRCP should be recommended in order to reach the correct diagnosis; I think that invasive procedure such as ERCP should follow a Non-invasive assessment of disease using CT and MRCP (outside institution management caused misdiagnosis in your cases). References are adequate.

COMMENTS TO AUTHORS

The manuscript addresses an interesting and actually not so rare condition of hepatic artery pseudoaneurysm. The subject is addressed thorough the presentation of the interesting clinical case. Presentation is done in informative and concise manner. Article also gives a detailed description of possible therapeutic approaches. Therefore I recommend this article for publication.
