COMMENTS TO AUTHORS

ESPS Manuscript NO: 26483 Title: Osteonecrosis of both knees in a woman with Crohn's disease

General comments The authors described the rare complication of Crohns’ disease. The focus of this study is interesting, but there are several difficulties in this manuscript. Specific comments

Abstract: It is necessary to edit the abstract highlighting the most important parts of the case study so that it can fit better with the content of manuscript. References: for case report there are too many references with one third old references, use more related and direct references to the case report and

limit literature references to essential information. Figures: the figures in manuscript are self-explanatory; add the arrow or arrow head on the figure to indicate the most important bone changes especially on the MRI images.
