COMMENTS TO AUTHORS

GENERAL COMMENTS The authors present a case report on incidentally discovered finding of sternum TB in a immigrated young man. The topic is unfortunately appropriate (see ebola emergency) since it deals with crucial issues of immigration/travel medicine/diagnosis. The paper gets the attention it deserves. Well written and reported. Noteworthy the aggregate finding of cerebral involvement. Since it has been presented as case report we consider it appropriate if the journal holds space for case report. Although the article is essential in its structure, the purpose is well defined and it transmits easily the message becoming of potential interest for the readers.

SPECIFIC COMMENTS Title: is appropriate. Abstract: well-defined and it seems to be in accordance with the text. Images: appropriate References: correct

COMMENTS TO AUTHORS

This is a nice article, which reported an unusual case that may lead to further research, but needs some further information such as; 1. In the microbiological assessment only reveal Acid fast bacilli confirmed by serology. The question is: what kind of serology test? 2. The result of Gram stain only mentioned in the abstract, it should be written in the introduction 3. No further explanation of the finding of tuberculoma, is this a 'paradoxical reaction' after three weeks anti-tuberculosis therapy?
