COMMENTS TO AUTHORS

This case report deals with a rare, but important issue of differentiation between benign and malignant psoas muscle abnormality in women with uterine cervical cancer using modern imaging modalities (PET/CT and DWMRI). The study was carefully performed to assess the findings of psoas muscle metastasis from each imaging modality. However, the authors should add something new in this report in order to make it valuable.

COMMENTS TO AUTHORS

Although the paper is proposed for a radiology journal, probably it would be of some interest to be more precise what kind of initial radiation therapy and what chemotherapy agents for the methastasis were used. Some CT or PET images of the complete/partial remission after the initial therapy could be interesting, if available. There are some newer references of case reports with psoas muscle methastases which could be mentioned.

COMMENTS TO AUTHORS

This is an interesting case. Well written, good length as case report. The author should double space the references.
