COMMENTS TO AUTHORS

The authors present an interesting case report on myocarditis in an athlete undergoing electrocardiogram, laboratory parameters, serologic markers, and echocardiography that were helpful in diagnosis of myocarditis, but are not specific. Magnetic resonance imaging (MRI) of the heart has become an important tool in the evaluation of patients with myocarditis and allows noninvasive appraisal of myocardial inflammation using late enhancement. In this case MRI is useful in diagnosis of myocarditis, however tomographic computed scan identified the presence of a myocardial bridge too. The paper is generally well-written and well- documented , although endomyocardial biopsy (the gold standard for diagnosis of myocarditis) has not performed , but I agree on this choice. I suggest to correct some typos, such as maybe (page 3, line 3) or infact (page 4, line 15) and so forth. Page 4, line 19: "Blood Biochemistry: if in the acute period can confirm the diagnosis by the findings of transient elevation of C-reactive protein, aspartate aminotransferase, lactate dehydrogenase, the MB form of creatine kinase, and cardiac troponin T in blood (9)." This is unclear, please specify.

COMMENTS TO AUTHORS

The case report is well written. However, I would suggest that the title must be changed, for example: Myocarditis in athlete and myocardial bridge: An innocent bystander? The authors should discuss the role of the computed tomography in the diagnosis the myocardial bridge.
