COMMENTS TO AUTHORS

Well written and clinically focused . Just a few suggestions: we suggest the Authors to add a table summarising the key elements and a paragraph describing the characteristics of thrombus in subgroups of patients such as diabetic ones.

COMMENTS TO AUTHORS

The authors provide a comprehensive summary of all the studies published so far which attempted to describe the morphology, cellular and histochemical composition of clots retrieved by coronary thrombectomy in patients early after STEMI. The main limitation of this report is that it does not provide any attempt to explain the reason why coronary thrombectomy fails to improve patients' outcome after STEMI (TASTE & TOTAL trials). It would add much to this review if such an attempt or hypothesis is provided based on current data.
