## COMMENTS TO AUTHORS

Dear Editor: In general, the paper was well written. Some concerns should be addressed before acceptance. 1. The unit of CRP (mg/dl) in the paper is not reasonable. The authors should recheck whether the unit of CRP in their paper was high-sensitivity kit produced (mg/l). 2. The authors should test whether difference between the peak CRP level and baseline CRP level will be associated with CVD events including mortality or not.

## COMMENTS TO AUTHORS

The authors are congratulated for this nice study on the prevalence of CRP rise following TAVI. Although clinical consequences are not completely clear, the study was nicely executed and the text is well written. I do not have specific comments.
