COMMENTS TO AUTHORS

-Comments to the author- General comments: This review article provides up-to-date summary of tele-monitoring of heart failure patients by pulmonary artery pressure monitoring based on the selected published literatures. Specific comments: Page 3, the section "PREVIOUSLY TESTED METHODS FOR MONITORING HF PATIENTS": Because body weight monitoring is fundamental and important issue in the field of HF monitoring, it is appropriate to add description, in more details of around 10 lines, of the summary of body weight monitoring and outcomes of HF re-hospitalization, mortality, etc., by citing two or three important literatures.

COMMENTS TO AUTHORS

The paper reviewed prognostic models based risk scores for patients with acute heart failure, which provides reference for clinical practice and further studies. Although the characteristics of each risk score were compared with statistical pertinence and applicability in practice, the guidance on how to choose these risk scores under different circumstances could be further discussed. Furthermore, as the grade of evidence and the recommendation level is crucial for clinical practice, the quality of each risk score study with the grade of evidence is suggested.
